- 1 Derivative-free optimization
- 2 Motivation and basic idea
- 3 A subspace decomposition framework
- 4 Global convergence and global rate
- 5 Applications to derivative-free optimization
- 6 Very preliminary numerical results
- 7 Concluding remarks

In this talk, to make things simple:

- we consider an unconstrained optimization problem

$$\min_{x \in \mathbb{R}^n} f(x);$$

In this talk, to make things simple:

- we consider an unconstrained optimization problem

$$\min_{x \in \mathbb{R}^n} f(x);$$

- we suppose that f is defined by a black-box providing only function values, without access to more structured function information such as derivatives.

In this talk, to make things simple:

- we consider an unconstrained optimization problem

$$\min_{x \in \mathbb{R}^n} f(x);$$

- we suppose that f is defined by a black-box providing only function values, without access to more structured function information such as derivatives.
- we aim for methods that use only function values, namely **derivative-free methods**.

- Why derivative-free?

- Why derivative-free?

Why work on derivative-free optimization? Because the problems are important and cool.

Trust-region framework

Algorithm (Trust-region framework)

Algorithm (Trust-region framework)

Step 1. Select a constant $\eta \in [0, 1)$, pick a starting point $x_0 \in \mathbb{R}^n$, choose $\Delta_0 > 0$, and set $k = 0$.

Algorithm (Trust-region framework)

Step 1. Select a constant $\eta \in [0, 1)$, pick a starting point $x_0 \in \mathbb{R}^n$, choose $\Delta_0 > 0$, and set $k = 0$.

Step 2. Choose subspaces $\mathcal{S}_k^{(i)}$ ($i = 1, 2, \dots, m_k$) of \mathbb{R}^n so that

$$\sum_{i=1}^{m_k} \mathcal{S}_k^{(i)} = \mathbb{R}^n.$$

Algorithm (Trust-region framework)

Step 1. Select a constant $\eta \in [0, 1)$, pick a starting point $x_0 \in \mathbb{R}^n$, choose $\Delta_0 > 0$, and set $k = 0$.

Step 2. Choose subspaces $\mathcal{S}_k^{(i)}$ ($i = 1, 2, \dots, m_k$) of \mathbb{R}^n so that

$$\sum_{i=1}^{m_k} \mathcal{S}_k^{(i)} = \mathbb{R}^n.$$

Step 3. For $i = 1, 2, \dots, m_k$, solve

$$\begin{aligned} \min & f(x_k + d) \\ \text{s.t.} & d \in \mathcal{S}_k^{(i)} \\ & \|d\| \leq \Delta_k, \end{aligned}$$

to get $d_k^{(i)}$.

Algorithm (Trust-region framework cont.)

Step 4. Obtain d_k by solving

$$\begin{aligned} \min \quad & f(x_k + d) \\ \text{s.t.} \quad & d = \sum_{i=1}^{m_k} t^{(i)} d_k^{(i)} \\ & 0 \leq t^{(i)} \leq 1, \quad i = 1, 2, \dots, m_k. \end{aligned}$$

Algorithm (Trust-region framework cont.)

Step 4. Obtain d_k by solving

$$\begin{aligned} \min \quad & f(x_k + d) \\ \text{s.t.} \quad & d = \sum_{i=1}^{m_k} t^{(i)} d_k^{(i)} \\ & 0 \leq t^{(i)} \leq 1, \quad i = 1, 2, \dots, m_k. \end{aligned}$$

Step 5. Let

$$\rho_k = \frac{f(x_k) - f(x_k + d_k)}{\sum_{i=1}^{m_k} \left[f(x_k) - f(x_k + d_k^{(i)}) \right]},$$

and set Δ_{k+1} so that

$$\Delta_{k+1} \geq \Delta_k \quad \text{whenever} \quad \rho_k > \eta.$$

Algorithm (Trust-region framework cont.)

Step 4. Obtain d_k by solving

$$\begin{aligned} \min \quad & f(x_k + d) \\ \text{s.t.} \quad & d = \sum_{i=1}^{m_k} t^{(i)} d_k^{(i)} \\ & 0 \leq t^{(i)} \leq 1, \quad i = 1, 2, \dots, m_k. \end{aligned}$$

Step 5. Let

$$\rho_k = \frac{f(x_k) - f(x_k + d_k)}{\sum_{i=1}^{m_k} \left[f(x_k) - f(x_k + d_k^{(i)}) \right]},$$

and set Δ_{k+1} so that

$$\Delta_{k+1} \geq \Delta_k \quad \text{whenever} \quad \rho_k > \eta.$$

Step 6. Let $x_{k+1} = x_k + d_k$, increment k by 1, and go to **Step 2**.

Levenberg-Marquardt framework

Algorithm (Levenberg-Marquardt framework)

Algorithm (Levenberg-Marquardt framework)

Step 1. Select a constant $\eta \in [0, 1)$, pick a starting point $x_0 \in \mathbb{R}^n$, choose a positive number σ_0 , and set $k = 0$.

Algorithm (Levenberg-Marquardt framework)

Step 1. Select a constant $\eta \in [0, 1)$, pick a starting point $x_0 \in \mathbb{R}^n$, choose a positive number σ_0 , and set $k = 0$.

Step 2. Choose nonzero subspaces $\mathcal{S}_k^{(i)}$ ($i = 1, 2, \dots, m_k$) of \mathbb{R}^n so that

$$\sum_{i=1}^{m_k} \mathcal{S}_k^{(i)} = \mathbb{R}^n.$$

Algorithm (Levenberg-Marquardt framework)

Step 1. Select a constant $\eta \in [0, 1)$, pick a starting point $x_0 \in \mathbb{R}^n$, choose a positive number σ_0 , and set $k = 0$.

Step 2. Choose nonzero subspaces $\mathcal{S}_k^{(i)}$ ($i = 1, 2, \dots, m_k$) of \mathbb{R}^n so that

$$\sum_{i=1}^{m_k} \mathcal{S}_k^{(i)} = \mathbb{R}^n.$$

Step 3. For $i = 1, 2, \dots, m_k$, solve

$$\min_{d \in \mathcal{S}_k^{(i)}} f(x_k + d) + \frac{1}{2} \sigma_k \|d\|^2$$

to get $d_k^{(i)}$.

Algorithm (Levenberg-Marquardt framework cont.)

Step 4. Solve

$$\min_{t \in \mathbb{R}^{m_k}} f(x_k + D_k t) + \frac{1}{2} \sigma_k \|t\|^2,$$

to obtain t_k , and then set

$$d_k = D_k t_k,$$

where $D_k = (d_k^{(1)} \ d_k^{(2)} \ \dots \ d_k^{(m_k)})$.

Algorithm (Levenberg-Marquardt framework cont.)

Step 4. Solve

$$\min_{t \in \mathbb{R}^{m_k}} f(x_k + D_k t) + \frac{1}{2} \sigma_k \|t\|^2,$$

to obtain t_k , and then set

$$d_k = D_k t_k,$$

where $D_k = (d_k^{(1)} \ d_k^{(2)} \ \dots \ d_k^{(m_k)})$.

Step 5. Let

$$\rho_k = \frac{f(x_k) - f(x_k + d_k)}{\sum_{i=1}^{m_k} [f(x_k) - f(x_k + d_k^{(i)})]},$$

and set σ_{k+1} so that

$$\sigma_{k+1} \leq \sigma_k \quad \text{whenever} \quad \rho_k > \eta.$$

Algorithm (Levenberg-Marquardt framework cont.)

Step 4. Solve

$$\min_{t \in \mathbb{R}^{m_k}} f(x_k + D_k t) + \frac{1}{2} \sigma_k \|t\|^2,$$

to obtain t_k , and then set

$$d_k = D_k t_k,$$

where $D_k = (d_k^{(1)} \ d_k^{(2)} \ \dots \ d_k^{(m_k)})$.

Step 5. Let

$$\rho_k = \frac{f(x_k) - f(x_k + d_k)}{\sum_{i=1}^{m_k} [f(x_k) - f(x_k + d_k^{(i)})]},$$

and set σ_{k+1} so that

$$\sigma_{k+1} \leq \sigma_k \quad \text{whenever} \quad \rho_k > \eta.$$

Step 6. Let $x_{k+1} = x_k + d_k$, increment k by 1, and go to **Step 2**.

Assumptions

Assumption

Assumption

- 1 *The function f is bounded from below and twice continuously differentiable, and $\nabla^2 f$ is bounded on \mathbb{R}^n .*

Assumption

- 1 *The function f is bounded from below and twice continuously differentiable, and $\nabla^2 f$ is bounded on \mathbb{R}^n .*
- 2 *The sequence $\{m_k\}$ is bounded.*

Assumption

- 1 The function f is bounded from below and twice continuously differentiable, and $\nabla^2 f$ is bounded on \mathbb{R}^n .
- 2 The sequence $\{m_k\}$ is bounded.
- 3 The smallest eigenvalues of $\sum_{i=1}^{m_k} P_k^{(i)}$ are bounded away from zero, where $P_k^{(i)}$ is the orthogonal projection matrix from \mathbb{R}^n onto $\mathcal{S}_k^{(i)}$.

Theorem

Suppose that the assumptions stated before hold, then the iterates $\{x_k\}$ generated by either of the frameworks satisfy

$$\lim_{k \rightarrow \infty} \|\nabla f(x_k)\| = 0.$$

Theorem

Suppose that the assumptions stated before hold, and additionally

$$\Delta_{k+1} \geq \alpha \Delta_k$$

for some constant $\alpha \in (0, 1]$, then the iterates $\{x_k\}$ generated by the trust-region framework satisfy

$$\min_{0 \leq \ell \leq k} \|\nabla f(x_\ell)\| \leq C_1 \sqrt{\frac{m}{k}},$$

where m is an upper bound of $\{m_k\}$.

Theorem

Suppose that the assumptions stated before hold, and additionally

$$\sigma_{k+1} \leq \beta \sigma_k$$

for some constant $\beta \geq 1$, then the iterates $\{x_k\}$ generated by the Levenberg-Marquardt framework satisfy

$$\min_{0 \leq \ell \leq k} \|\nabla f(x_\ell)\| \leq C_2 \sqrt{\frac{m}{k}},$$

where m is an upper bound of $\{m_k\}$.

We have thus the worst case complexity: $O(\varepsilon^{-2}m)$

We have thus the worst case complexity: $O(\varepsilon^{-2}m)$

Using this and the WCC $O(n^2\varepsilon^{-2})$ for subproblems,

- a reasonable choice for m is $O(\sqrt{n})$
- a reasonable subproblem solution accuracy is $O(n^{-\frac{1}{4}})$

Properties of the framework

Properties of the framework

- *It does not explicitly require derivatives.*

Properties of the framework

- *It is naturally multilevel.*

Properties of the framework

- *It does not explicitly require derivatives.*
- *It is naturally parallel.*
- *It is naturally multilevel.*

Our goal

Parallel and *multilevel* algorithms *without using derivatives* and capable of solving relatively *large* problems.

Very preliminary numerical results

- Use the Levenberg-Marquardt framework
- Subproblem solver: NEWUOA
- Number of subspaces: $\sqrt{n/2}$
- Benchmark: NEWUOA (NPT=2N+1; RHOEND=1.0E-6)
- Very preliminary: not parallel, not multilevel, not large-scale ...
- Dimension of test problems: 25, 30, 35, 40
- Denote our code as SSD
